

Automatic Bagging Machine

The Automatic Bagger is a cost effective method for bagging your bottles. Designed for any output blow moulds, this machine is capable of bagging up to 2 packs per minute. One Operator can run as many as 8 machines at a time (depending on machine output) allowing maximum use of available labour.

The machine comes as standard with a powder coated steel frame in a choice of colours (Red Standard) or as an optional extra it is available in stainless steel.

On an Automatic Bagger the bottles enter into an accumulation area and are collated into rows automatically. While this is happening a Bag is made to a preset length, cut and sealed and placed on a pair of clamp plates in front of the accumulation area. When a full pack of bottles has been accumulated it is transferred into the Open bag and then the open end is sealed.

The Bag is then ejected out of the machine and can be automatically stacked by an optional 3-position pallet stacker or diverted onto a roller conveyor for transportation to a central loading area.

The BottleTech Bagger requires a conventional roll of Lay flat plastic tubing without gussets or pre made cuts and seals, This is far cheaper than the pre made rolls associated with a semi automatic Bagger.
